

# The brief said “interaction of colors.” As a UX major, that sounded like a UI problem.

Figma handled visual direction; iteration happened directly in the app using vibe coding. AI handled implementation while I focused on what the interaction should feel like, making the gap between design and build much smaller.

RESEARCH\_

Color had to be something people could manipulate, not just study.

Most responses to the assignment went editorial. I kept returning to Albers’s argument that color has no fixed identity. That felt like a software problem as much as an art one.

CHALLENGE\_

A proof of concept became a product with a real identity.

The first submission was just a working prototype. Spring break became the space to push it into a more complete tool, adding modes, tightening the interaction model, and developing the amber HUD aesthetic.
