

LoomLearn

KEY INSIGHT_

“Building for accessibility first made the product stronger for everyone.”

PROBLEM_

The problem wasn't the tools, it was the switching between them.

LoomLearn integrates Cornell notes, Pomodoro timers, mind maps, spider charts, and flashcards into a single drag-and-drop platform. Designed with dyslexic learners in mind, built for anyone juggling too many tools to study effectively.

MY ROLE_

Sole designer across research, UX, UI design, and prototyping.

SOLUTION_

One canvas. Six tools. No switching.

Cornell notes, mind maps, to-do lists, spider charts, flashcards, and Pomodoro timers all coexist on one rearrangeable workspace, so the learning flow stays in one place.

Dyslexic learners don't struggle with the tools. They struggle with context switching.

LoomLearn was designed around the idea that students should not have to keep moving between apps just to study. The platform brings common learning techniques into a single modular workspace.

RESEARCH_

The pain point was switching context, not lacking features.

Digital learners, especially those with dyslexia, lose momentum when notes, timers, flashcards, and diagrams all live in separate places. I mapped two personas around that friction: Emma and Aadi.

CHALLENGE_

A drag-and-drop interface had to feel familiar, not overwhelming.

The interaction model drew from Scratch: low-threshold, modular, and customisable. Every technique became a draggable object instead of a buried menu option.

Emma Carter

Demographics:
Age: 19
Location: Manchester
Profession: University Student (First Year)

Background:
Emma is a first-year university student juggling lectures, lab work, and independent study sessions. She finds it difficult to keep up with her course load, especially when it comes to organising notes and retaining large amounts of information. Emma was recently diagnosed with dyslexia, which makes her learning journey unique.

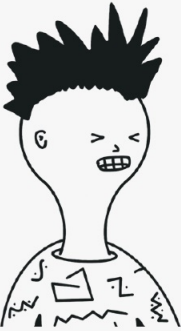

Frustrations:

- Using different tools (physical notebooks, apps) is overwhelming and unproductive.
- Most apps lack customisation and aren't designed to meet her learning style.

Goals:

- Structure her study process using tools like Cornell notes, flashcards, and mind maps to better understand complex topics.
- Stay focused during study blocks using timers like the Pomodoro technique.
- Organise all her learning resources in one place without switching between apps.

Needs:
A single, user-friendly app that integrates effective learning techniques, is easy to customise, and helps her manage her university workload efficiently.

Aadi Singh

Demographics:
Age: 16
Location: Kuala Lumpur
Profession: High School Student (11th Grade)

Background:
Aadi is a high school student preparing for his IGCSEs. He's highly ambitious but often struggles to focus and retain information during study sessions. He has tried using traditional methods like physical notes and flashcards but finds them time-consuming and scattered..

Frustrations:

- Traditional learning techniques aren't easy to manage in the digital age.
- Switching between apps or tools wastes valuable study time.

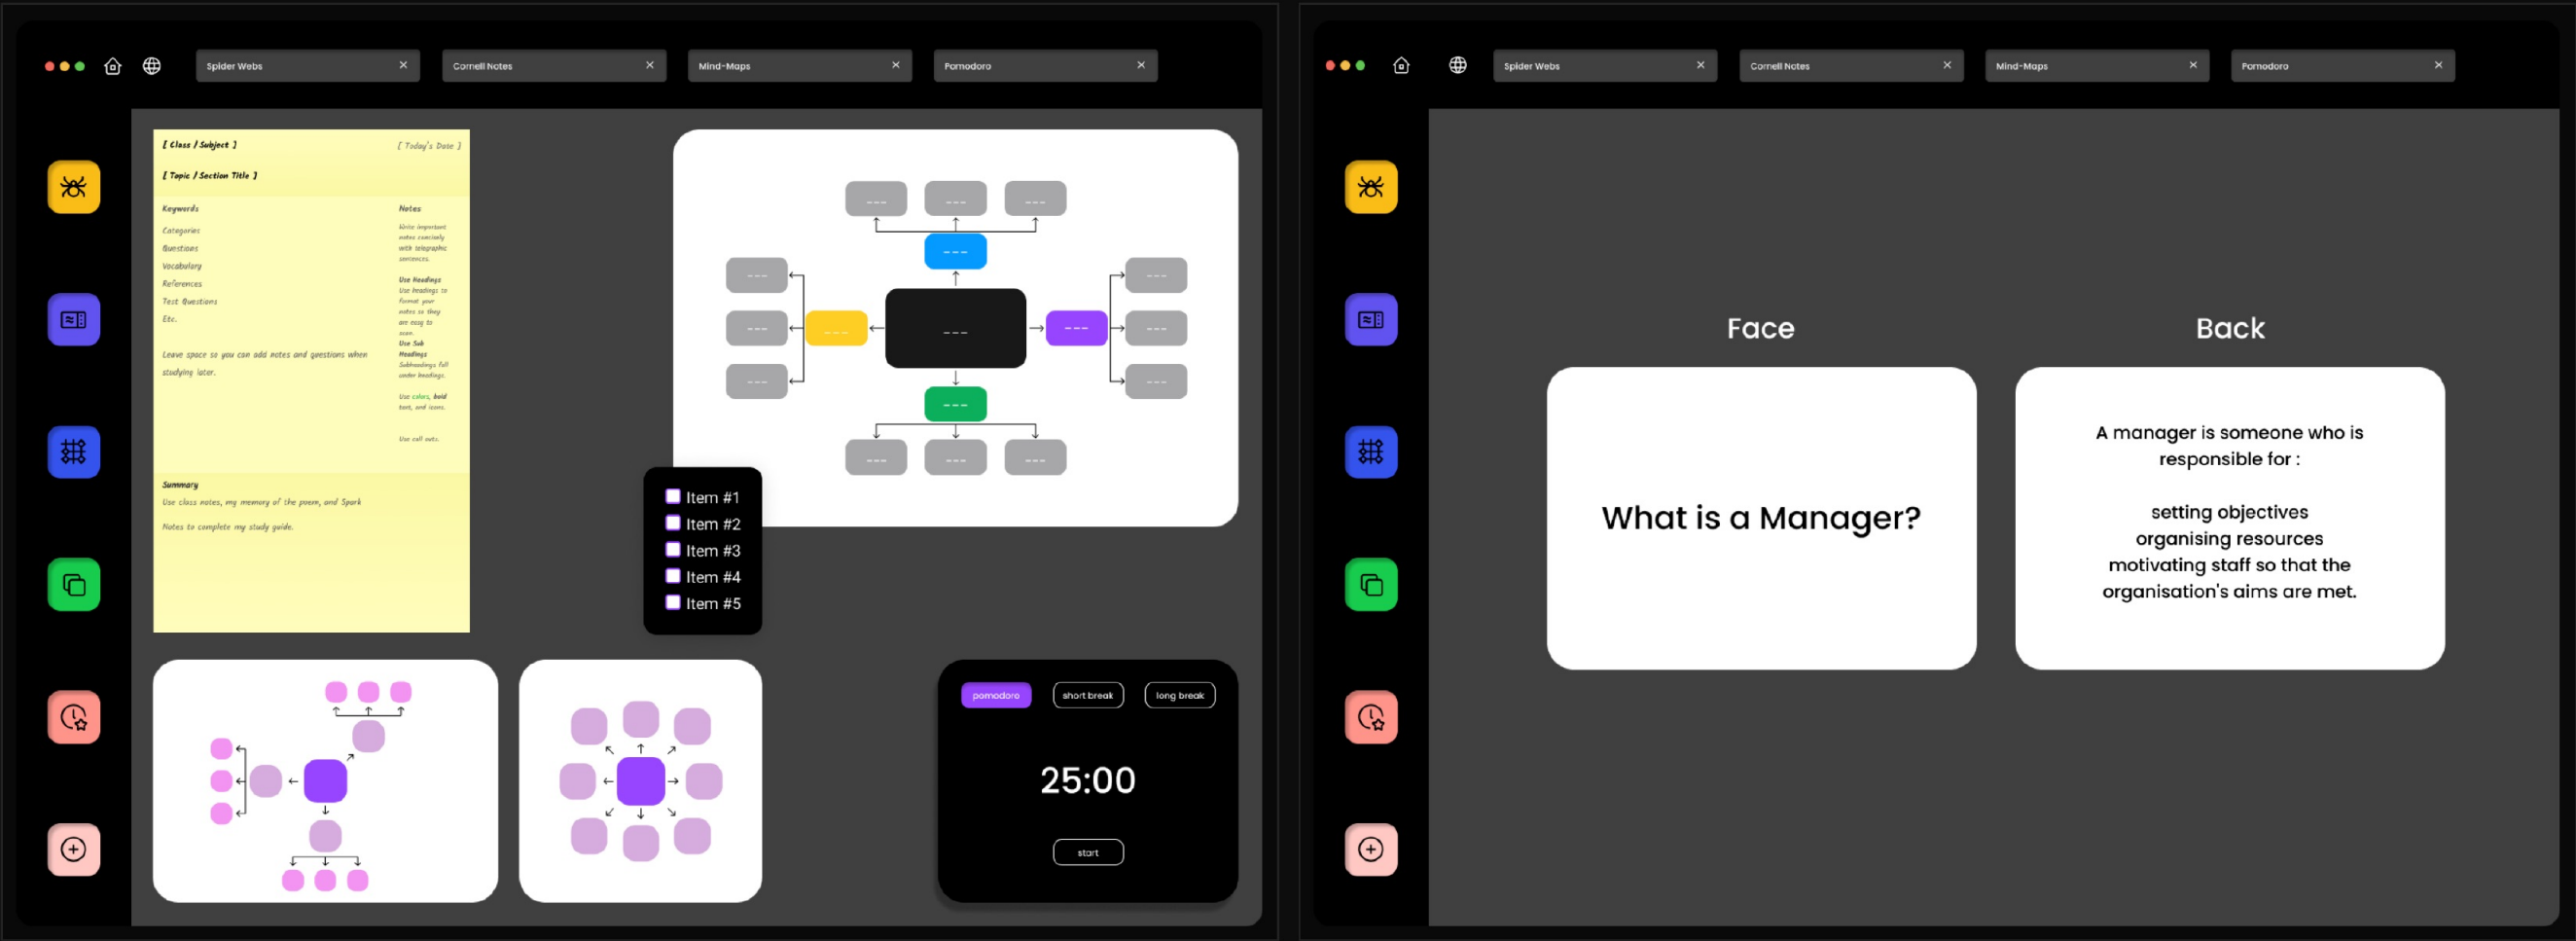

Goals:

- Structure her study process using tools like Cornell notes, flashcards, and mind maps to better understand complex topics.
- Stay focused during study blocks using timers like the Pomodoro technique.
- Organise all her learning resources in one place without switching between apps.

Needs:
A distraction-free, customisable learning app that integrates proven study techniques to boost his focus, productivity, and information retention during exams.

One canvas. Six tools. No switching.

A desktop learning platform where Cornell notes, mind maps, to-do lists, spider charts, flashcards, and Pomodoro timers coexist on one canvas, rearrangeable and resizable for each study session.

OUTCOME_

Accessibility-first thinking made the product stronger for everyone.

APPROACH_

The system stayed simple by treating every learning method as one movable module.

NEXT_

I'd revisit onboarding so the workspace logic is obvious from the first session.
